EVENTPILOT | TEST PROTOCOL

EP

Complete application test guide

A practical, start-to-finish test using one wedding-reception scenario. It proves the user experience, LangGraph workflow, MCP tools, Langfuse tracing, revision, risk decisions, approval, export, and persistence.

SCENARIO	Meera and Karthik Wedding Reception
SCALE	350 guests | Whitefield, Bengaluru
BUDGET	INR 12,00,000 | Saturday, 20 March 2027
TIME	About 15-20 minutes for a complete test

Use this PDF as both a tester checklist and a reviewer demonstration script.

01 | DEMO INTRODUCTION

Set the reviewer context

Open with the outcome, then show how the application turns a realistic event brief into a human-approved plan.

SUGGESTED OPENING

EventPilot is an autonomous event-planning workspace. A shared brief is interpreted by specialist agents, grounded with MCP tools, coordinated through LangGraph, traced in Langfuse, and presented for human review and approval.

WHAT REVIEWERS WILL SEE

1. A wedding invitation becomes a complete event brief.
2. Six specialists create evidence-backed recommendations.
3. A manager synthesizes, validates, and presents one reviewable plan.

KEY MESSAGE

AI accelerates planning, but it does not make the final decision. The event owner resolves risks, approves the plan, and controls final export.

After this introduction, start the stack below. Keep the API terminal and Langfuse browser tab visible during the run.

TERMINAL 1 - MCP SERVER

cd backend && source .venv/bin/activate && python -m app.mcp.server
Expected: service listening on http://127.0.0.1:8000/mcp

TERMINAL 2 - API

cd backend && source .venv/bin/activate && uvicorn app.main:app --reload --port 8001
Expected: /health returns status ok.

TERMINAL 3 - REACT

cd frontend && npm run dev
Open the displayed URL, normally http://127.0.0.1:5173.

Pre-flight: confirm the browser does not say API unavailable, keep Langfuse open, and begin with a fresh Plan with AI conversation. MCP has a safe in-process fallback, but keep it running to show the full protocol path.

02 | THE TEST INPUT

Use the invitation attachment

This is the fastest realistic way to prove that EventPilot can turn event data into a validated shared brief.

RECOMMENDED ACTION

Open Plan with AI. In the composer, click Try wedding invitation. A file chip named Meera-and-Karthik-Wedding-Invitation.txt appears. Click Send without adding any extra text.

Expected extracted brief

Event type	Wedding
Event name	Meera And Karthik Wedding Reception
Date	2027-03-20
Location	Whitefield, Bengaluru
Attendees	350
Budget	INR 12,00,000
Objective	Warm family celebration with smooth guest welcome, ceremony timing, photography and dinner flow.

PASS CONDITION

The assistant confirms the complete brief and enables plan generation. If a field is missing, answer only that question; do not restart the conversation.

03 | GENERATE AND INSPECT

Run the LangGraph planning workflow

This section verifies the visible product flow and the agent orchestration represented by the Planning Run graph.

1	**Generate plan**	Confirm the extracted brief, then select Generate event plan.	A saved event and live planning run begin.
2	**Stay in Plan with AI**	Watch the agent status rather than leaving the page.	The chat shows progress and a completed planning response.
3	**Open Planning Run**	Use the sidebar Planning run item.	Timeline shows the 11 workflow stages.
4	**Open Workflow graph**	Switch from Timeline to Workflow graph.	Event brief -> six specialist agents -> Event Manager -> Review -> Final plan.
5	**Inspect a step**	Open Logistics or Finance.	Tool input, result summary, verification, recovery context, and trace information are visible.
6	**Open Overview**	Use Overview only after the run completes.	Planning status, forecast, confidence, and open risks are visible.

PASS CONDITION

The plan contains a venue recommendation, six budget lines, a five-item 12-hour agenda, marketing readiness, two to five risks, and agent activity. The review stage completes before the plan is presented.

04 | VERIFY THE TECHNICAL EVIDENCE

Show MCP and Langfuse

This proves that the event plan is an observable multi-agent workflow, not a static frontend response.

MCP EVIDENCE

In the Planning Run, open specialist steps. Verify tool calls such as venue_search, budget_validation, schedule_conflict_check, event_requirements, marketing_readiness, and operational_risk_assessment.

Expected: structured input, result summary, timing, and success status.

LANGFUSE EVIDENCE

Open the newest eventpilot-plan-generation trace. Expand the trace tree.

Expected: Azure generation, structured result, latency, token/cost details, and MCP observations. The prompt should reflect the wedding brief, not a birthday template.

WHAT TO SAY TO A REVIEWER

LangGraph coordinates the order and shared state. MCP supplies bounded planning evidence. Langfuse records the generation and tool activity. The UI makes the result reviewable by a human planner.

TROUBLESHOOTING

No trace: confirm Langfuse keys and refresh the trace list. No tool span: confirm the MCP terminal is running; the fallback note means the API used its local tool implementation. API unavailable: confirm port 8001.

05 | TEST A REVISION AND RISK DECISIONS

Prove that the plan can change safely

Use the same event. The revision should produce a new observable operation without losing the original saved workspace.

1	**Open Budget**	Go to Plan workspace > Budget.	Current forecast and category allocations display.
2	**Reduce budget**	Click Reduce budget by 20%.	Available budget becomes INR 9,60,000.
3	**Verify revision**	Review the updated allocation and activity.	Forecast stays at or below the reduced ceiling and preserves contingency where possible.
4	**Open Langfuse**	Refresh and open eventpilot-budget-revision.	Trace contains the revised budget context.
5	**Open Risks**	Go to Plan workspace > Risks.	Every generated risk has Monitor or Set fallback.
6	**Record actions**	Choose Monitor for watchable risks and Set fallback for high-impact risks.	Open-risk count decreases until it reaches zero.

PASS CONDITION

A revision is persisted, a distinct budget-revision trace exists, and all risk decisions are recorded by the human planner.

06 | APPROVAL, EXPORT, AND PERSISTENCE

Complete the human-in-the-loop flow

This is the final application-level test: draft output remains reviewable, final output remains human-approved.

1	**Preview before approval**	From Overview, click Preview PDF.	PDF opens and is visibly marked as a draft/awaiting approval.
2	**Confirm readiness**	Ensure the open-risk count is zero.	Overview changes to Ready to approve.
3	**Approve plan**	Click Approve plan.	Status changes to Approved and approval is stored for this event.
4	**Export final PDF**	Click Export PDF.	A final Event Blueprint downloads with current plan data.
5	**Refresh browser**	Reload the application, then reopen the event.	Saved brief and latest plan reappear from SQLite.
6	**Restart API (optional)**	Restart FastAPI and reopen the same event.	Brief and latest plan remain available; planning runs can be reopened.

IMPORTANT

Agents recommend and validate. The event owner records risk decisions, approves the plan, and remains responsible for any real booking or communication.

07 | FINAL SCORECARD

Mark the complete flow as passed

Use this page as the final evidence sheet during your test or presentation.

PASS	**Services**	MCP, FastAPI, and React start without errors.
PASS	**Invitation intake**	Sample invitation pre-fills a complete wedding brief.
PASS	**LangGraph**	Timeline and Workflow graph show the multi-agent run.
PASS	**Plan quality**	Venue, budget, 12-hour agenda, marketing, risks, and activity are present.
PASS	**MCP**	Specialist tool calls show structured output.
PASS	**Langfuse**	Plan-generation trace and tool observations are visible.
PASS	**Revision**	20% reduction creates updated plan data and budget-revision trace.
PASS	**Human control**	Risk actions are required before approval and export.
PASS	**PDF**	Draft preview works before approval; final export works after approval.
PASS	**Persistence**	Saved event and latest plan survive browser refresh.
PASS	**Regression checks**	Backend suite: 54 passed. Frontend production build: passed.

CLOSING STATEMENT

EventPilot demonstrates a stateful, manager-led planning workflow: specialist agents use controlled tools, LangGraph coordinates their work, Langfuse makes the run inspectable, and the human owner retains final approval.
